

## Grapples for Forklifts

Forklift Grapple - On excavators, grapples can be used together with the crowing operation of the bucket cylinder. They can mount directly to the jib and could be used when processing and handling construction materials, domestic or aggregate waste items, and timber. The grapple's boxed design has added support bridging. This manufactured design provides the grapple with maximum strength and support by stopping the body from breaking and rotating during its operation.

The grapple as well as all of its moving parts are constructed of hardened steel. The pivot points are designed in order to guarantee holding ability and supreme closing force. The individual operating it has the capacity to deal with all sizes and varieties of materials utilizing the jaws built-in at the end of the grapple with toes. This enables the jaws to be able to close through one another in a finger configuration for maximum handling capacity.
